Case Study: Employee Management Using Java Stream API

Problem Statement

Create a list of Employee objects, where each Employee object contains the following attributes:

1. **Employee ID** (id)
2. **Employee Name** (name)
3. **Job Title** (job)
4. **Qualification** (qualification)
5. **Date of Joining** (doj)
6. **Salary** (salary)
7. **Department** (dept)

Task

Using the Java Stream API, find the **highest-paid employee in each department**.

Display the employee details department-wise, including their ID, name, job, qualification, date of joining, salary, and department.

Implementation Requirements

- Create two separate Java classes: Employee.java and Main.java.
- Use a collection to store Employee objects.
- Perform the operation using the Java Stream API.
- Display the top-earning employee from each department.
